

## Protein Synthesis and Targeting in Yeast (Nato ASI Subseries H:)

Due to fundamental similarities between the yeast *Saccharomyces cerevisiae* and multicellular organisms at the molecular level, and the powerful range of experimental tools available for this yeast, *S. cerevisiae* is proving an ideal model system for studies on protein synthesis and targeting. The topics covered are: - Messenger RNA stability and translation.- The translation apparatus. - Translational control and fidelity. - Protein targeting to the mitochondrion. - Nuclear transport. - The secretory pathway. - Protein folding and degradation. - Protein splicing. Modern and often novel molecular, genetic and biochemical approaches as well as most recent data are provided. The reader will gain a comprehensive view of the current status of the field.
